

POLICY BRIEFING NOTE: SUMMARY
Bill 216 - *Food Literacy for Students Act, 2020*

Policy issue

Canadians - including Ontario elementary, middle and high school students - often do not have the knowledge, skills and/or opportunity to actualize their personal health and well-being in relation to food, or to participate as informed and engaged citizens in their food systems.

Background

Canadians know very little about modern food production. Many argue that society's disconnect from where our food comes from and how it is grown and produced is contributing to social and ecological harm. Food skills are being eroded in households regardless of socio-economic status and we've seen a significant increase in the consumption of processed foods. This has contributed to growing rates of diet-related diseases that are disproportionately affecting those who already experience health inequities.

With rising health concerns, limited access to food for many, and growing concerns about climate change as well as other environmental crises, individuals and society as a whole need to be more informed about nutrition and food systems, empowered with food skills, and taught to think critically about food and nutrition to be able to improve their own personal health and the health of our planet.

Defining Food Literacy

The concept of food literacy is growing in interest but a common definition has not yet been established. It is increasingly being recognized that we need to think of food literacy more broadly through two core dimensions: (1) health and well-being, and (2) food systems. Food literacy education also needs to include 3 different levels of literacy: declarative knowledge (i.e., factual information or "knowing of/about"), procedural knowledge (i.e., food skills or "knowing how to") and critical reflection.

Current Situation

When we look at the curriculum we see gaps in all levels of food literacy: declarative, procedural knowledge as well as critical literacy. The current Ontario curriculum mainly emphasizes nutrition literacy through the Health and Physical Education Curriculum and focuses on declarative knowledge.

Students who do not take optional specialized food courses are not likely to get much more than basic nutritional education (e.g., learning about Canada's Food Guide) in their schooling.

Taken all together, Ontario students can better advance their personal health and well-being and participate effectively in their food systems if they have knowledge, personal skills, and critical thinking skills relating to health and well-being as well as food systems.

Recommendations:

Food literacy is a pedagogical domain that can be improved through a *Food Literacy for Students Act*. If it is addressed comprehensively it can improve the health of our population and food systems.

We recommend that the Government of Ontario:

1. **Implement Bill 216: A Food Literacy for Students Act** at the earliest convenience, making experiential food literacy education mandatory from grades 1-12.
2. **Adopt a definition and a broad conceptualization of food literacy** that includes both the dimensions of health and well-being as well as food systems.
3. **Begin to meaningfully consult and engage with a broad range of individuals and groups** including educators, dietitians, community organizations, food professionals such as chefs, and Indigenous nations to ensure that the approach for implementing Bill 216 is appropriate in different contexts, cultures and worldviews.
4. **Determine a set of desired competencies and expected food literacy benchmarks for different grade levels**, including expectations for graduation from grade 12. Ensure that these desired competencies include Indigenous and cultural references throughout each aspect of food literacy so as to be relevant for all students and to acknowledge neo-colonial issues in modern health approaches and food systems. Also ensure that food literacy education includes experiential hands-on learning as well as critical literacy, as these will complement theoretical learning and increase knowledge solidification and future action.
5. **Identify and document gaps in food literacy education** across the dimensions of health and nutrition as well as food systems for each level of food literacy (declarative, procedural and critical literacy).
6. **Review Ontario's current curricula to explore how it could be modified to best achieve specific food literacy objectives throughout and across different subject areas.** This effort can draw on existing resources, lesson plans and materials that have been developed by teachers and organizations in this field.
7. **Ensure the modified curricula reflects the cultural diversity of Ontario, including the perspectives and traditions of BIPOC (Black, Indigenous, and People of Colour) communities and their relationships to the land and food systems.** Land-based and experiential learning should be prioritized wherever possible.
8. **Develop a multi-year roll-out plan** that includes curriculum changes, the engagement of community partners with an expertise in food literacy, professional development for teachers and other school staff, infrastructure modifications and policy development. This roll-out plan should take a flexible approach to enable school boards and school communities to implement the legislation based on their own context, needs, opportunities, gaps and assets in their own communities.
9. **Allocate a sufficient budget** to support the development and implementation of a comprehensive, effective, and sustainable food literacy curriculum that incorporates the above recommendations.

See our full policy briefing note (pages 3-34) for additional discussion and considerations for rolling out Bill 216: A Food Literacy for Students Act.

POLICY BRIEFING NOTE
Bill 216 - *Food Literacy for Students Act, 2020*

Brief prepared by:

Policy issue:

Canadians - including Ontario elementary, middle and high school students - often do not have the knowledge, skills and/or opportunity to actualize their personal health and well-being in relation to food, or to participate as informed and engaged citizens in their food systems.

Definition and Conceptualization of Food Literacy:

The concept of food literacy is growing in interest but a common definition has not yet been established. It is increasingly being recognized that we need to think of food literacy more broadly. This brief emphasizes two core dimensions: (1) health and well-being, and (2) food systems.

Health Canada has adapted the definition of food literacy by [Cullen and Colleagues \(2015\)](#) in their [2019 Dietary Guidelines](#):

“Food literacy includes food skills and practices that are learned and used across the lifespan to participate within a complex food environment. Food literacy also means considering the social, cultural, economic and physical factors related to food” (p. 36)

In the context of education, the original definition by Cullen and Colleagues may be more applicable given that it uses the language of “a complex food system” instead of “a complex food environment”. It also references

the ideas of participating in food systems, making decisions to achieve personal health and names the concept of sustainability. Cullen and Colleagues define food literacy as:

“the ability of an individual to understand food in a way that they develop a positive relationship with it, including food skills and practices across the lifespan in order to navigate, engage, and participate within a complex food system. It’s the ability to make decisions to support the achievement of personal health and a sustainable food system considering environmental, social, economic, cultural, and political components” (p. 143).

In 2016 the Ontario Dietitians in Public Health went through a process to determine [attributes for food literacy](#) and concluded that "Food literacy is a set of interconnected attributes organized into the categories of food and nutrition knowledge, skills, self-efficacy/confidence, food decisions, and other ecologic (external) factors such as income security, and the food system."

These two core dimensions, health and well-being and food systems, as they relate to food literacy are shown in Figure 1.

Figure 1: Food literacy conceptualization including dimensions, knowledge and action elements, and barriers or enablers (adapted by Martin from [Azevedo-Perry et al., 2017](#); published in Martin & Massicotte, in press; [Rosas et al., 2021](#))

For food literacy education to be effective it also needs to include 3 different levels of literacy: declarative knowledge (i.e., factual information or “knowing of/about”), procedural knowledge (i.e., food skills or “knowing how to”) and critical reflection (see Table 1 for more details).

Table 1: Food Literacy Framework	
Declarative Knowledge (Functional food literacy)	Basic knowledge and communication of credible, evidence-based nutrition, food, and agri-food systems information, involving accessing, understanding and evaluating information.
Procedural Knowledge (Interactive food literacy)	Development of personal skills (i.e., cooking, farming/growing, harvesting, etc.) regarding food and nutrition issues, and agri-food systems, involving informed decision-making, goal setting and practices to enhance nutritional health and well-being and agri-food systems sustainability.
Critical reflection (Critical food literacy)	Respect for different cultural, family and religious beliefs in terms of food and nutrition. Understanding the wider context of agri-food systems (production, processing, distribution, marketing, consumption and waste) and nutritional health, and advocating for individual, community and institutional changes that enhance nutritional and agri-food systems health at the local, regional, national and global scales.
Source: Martin & Massicotte (in press; adapted from Slater (2013) , p. 623)	

Taken all together, Ontario students can better advance their personal health and well-being and participate effectively in their food systems if they have factual knowledge, procedural skills, and critical thinking skills relating to health and well-being as well as food systems.

Background:

Although there is little research on Canadians’ food literacy, the Conference Board of Canada released a report in 2013 that showed that our food literacy levels are limited, especially about food systems (Howard & Brichta, 2013). The Canadian Centre for Food Integrity confirmed this finding in their 2019 annual report, which indicated that **91% of Canadians know little, very little or nothing about modern food production (CCFI, 2019)**.

The past decades have seen large cutbacks of food skills education in the Ontario school curriculum. Hands-on cooking programs are now voluntary and are only taken by a minority of students. In many families, children are also no longer learning how to cook at home for a variety of reasons; **food skills are being eroded in households regardless of socio-economic status**. The mass deskilling in growing and preparing healthy foods has happened at the same time as we’ve seen an increase in the consumption of processed foods. This has contributed to growing rates of diet-related diseases. Unhealthy diets have been estimated to [cost Canada \\$13.8 billion per year](#) in lost productivity and healthcare costs and are [costing Ontario \\$7.4 billion annually](#). These impacts are disproportionately affecting those who already experience health inequities (e.g., low socioeconomic status, poor mental health, Indigenous people).

Public Health research has for years shown that **improved nutritional knowledge and food skills would promote cooking at home and better diet quality** ([Desjardins & Azevedo, 2013](#); [Nutrition Connections evidence briefs](#)). Further evidence suggests that eating habits developed during early childhood are sustained into adolescence and adulthood, and are associated with reduced risks of chronic diseases later in life ([Health Canada, 2012](#); [Ratcliff et al., 2011](#)).

Other public health and community voices have added that **food choices are often out of individuals' control** and depend on their socio-economic status, housing conditions and other social determinants of health. All of these can impact access to kitchen facilities, food, time and other conditions needed for healthy eating behaviours ([Azevedo-Perry et al., 2017](#)). As such, some food literacy programs and approaches put more **emphasis on educating about how to improve access to food by** teaching gardening skills and how to shop on a budget. These programs may teach about food systems and raise awareness of how to improve community access to healthy and sustainable food.

Many also argue that society's disconnect from where our food comes from and how it is grown and produced can **contribute to social and ecological harm** ([Clapp, 2020](#)). Researchers such as [Lang \(2005\)](#) and [Nemecek et al \(2016\)](#) recommend that food be discussed in a comprehensive and food systems-oriented way so that environmental and other issues related to our food supply chains are considered (e.g., refraining from making nutrition recommendations for individuals to consume large amounts of fish while fish stocks are declining).

With rising health concerns, limited access to food for many, and growing concerns about climate change as well as other environmental crises, **individuals and society as a whole need to be more informed about nutrition and food systems, empowered with food skills, and taught to think critically about food and nutrition** to be able to improve their own personal health and the health of our planet ([Willett et al., 2019](#)).

Current Situation:

When we look at the curriculum, while keeping in mind the broader conceptualization of food literacy, we see gaps in all levels of food literacy: declarative (functional, including factual information), procedural knowledge (interactive, including food skills) as well as critical literacy. The current Ontario curriculum mainly emphasizes nutrition literacy through the Health and Physical Education Curriculum and focuses on declarative knowledge.

- At the moment hands-on food skills are primarily taught as optional courses and only in high school. Some teachers and community partners are doing some [fantastic work](#) teaching the curriculum through hands-on learning, but these efforts are voluntary and can only reach a small amount of students at a school.
- Education about food systems, their complexity, and how they intersect with other issues such as health and wellbeing, equity, food cultures and traditions, food security or insecurity, and the environment is mainly offered in optional high school courses and is not very present in the mandatory curricula. Many teachers and educators are linking a variety of subjects and curriculum expectations to broader food system education (see Appendix A); however, this is only possible when the teacher understands and intentionally makes these connections.

As such, students who do not take optional specialized food courses are not likely to get much more than basic nutritional education (e.g., learning about Canada's Food Guide) in their schooling. **Table 2 presents examples of food literacy competencies that are missing or are minimally covered in the curriculum based on an initial scan.**

Table 2: Examples of food literacy gaps in the Ontario Curricula		
	Health and Nutrition	Food Systems
Declarative knowledge gaps	<ul style="list-style-type: none"> Knowing about foods and what ingredients are in them 	<ul style="list-style-type: none"> Understanding where food comes from and how and where it is produced, processed, sold and thrown away Understanding what local foods are available, how and where to obtain them Understanding how food systems impact the environment and contribute to climate change
Procedural knowledge gaps	<ul style="list-style-type: none"> The development of food skills, self-efficacy and confidence (how to cook food including following and adapting recipes or accommodating preferences and dietary needs of family members) 	<ul style="list-style-type: none"> Knowing how to find and choose sustainable foods and support local farmer livelihoods The development of food skills (how to grow food; how to sustainably harvest, hunt, fish for or forage for food; how to make good use of leftovers and avoid food waste)
Critical literacy gaps	<ul style="list-style-type: none"> Celebrating and having respect for different cultural, family and religious beliefs and practices in terms of food and nutrition Understanding the social determinants of health as they relate to food and nutrition 	<ul style="list-style-type: none"> The impact of the food system on individual health, broader societal and economic wellbeing, and the environment as well as how to think critically and influence the food system Understanding the impact of food systems on the availability of cultural foods
See Appendix A for a more thorough illustration of food literacy gaps that exist in the Ontario curriculum.		

It is important to note that some schools in Ontario have advanced food literacy programs, which often exist as a result of the initiative of a champion teacher, principal, parent, community member, or a partnership with a community food organization. Many of these programs come about as a result of external grant opportunities and/or community partnerships.

Recommendations:

Food literacy is a pedagogical domain that can be improved through the *Food Literacy for Students Act*. If it is addressed comprehensively it can improve the health of our population and food systems.

We recommend that the Government of Ontario:

1. **Implement Bill 216: *Food Literacy for Students Act*** at the earliest convenience, making experiential food literacy education mandatory from grades 1-12.
2. **Adopt a definition and a broad conceptualization of food literacy** that includes both the dimensions of health and well-being as well as food systems. We recommend making use of the definition by Cullen and Colleagues (2015) outlined in this briefing note to inform a definition for the legislation. (See Definition and Conceptualization of Food Literacy on Page 1 above).
3. **Begin to meaningfully consult and engage with a broad range of individuals and groups** including educators, dietitians, community organizations, food professionals such as chefs, and Indigenous communities to ensure that the approach for implementing Bill 216 is appropriate in different contexts, cultures and worldviews.
4. **Determine a set of desired competencies and expected food literacy benchmarks for different grade levels**, including expectations for graduation from grade 12. Ensure that these desired competencies include Indigenous and cultural references throughout each aspect of food literacy so as to be relevant for all students and to acknowledge neo-colonial issues in modern health approaches and food systems. Also ensure that food literacy education includes experiential hands-on learning as well as critical literacy, as these will complement theoretical learning and increase knowledge solidification and future action. (See Appendix A for a set of competencies that could be built upon)
5. **Identify and document gaps in food literacy education** across the dimensions of health and nutrition as well as food systems for each level of food literacy (declarative, procedural and critical literacy; see Appendix A for an initial scan)
6. **Review Ontario's current curricula to explore how it could be modified to best achieve specific food literacy objectives throughout and across different subject areas.** This may be by modifying curriculum objectives, for example, modifying mention of "social systems" to specifically reference "food systems", or using food as an example across different subject areas. This effort can draw on existing resources, lesson plans and materials that have been developed by teachers and organizations in this field (see Appendix A for some examples of these resources).

Curriculum expectations should be reviewed/developed by experts in the areas of education (especially teachers), food, nutrition, health, food systems and other relevant areas of expertise and assessed for age/developmental stage using a health equity lens. Revised expectations should be evidence-based and aligned with best practices for teaching food literacy to children and youth. These changes should be substantial enough in terms of time and content to achieve the desired competencies. The interests of students should be at the centre of this work, ensuring that they gain the knowledge and skills to support their long-term health and wellbeing. Curricula that advances specific stakeholder group and/or private sector interests, and lessons that include marketing or advertising to students should be absent from the curriculum.

7. **Ensure the modified curricula reflects the cultural diversity of Ontario, including the perspectives and traditions of BIPOC (Black, Indigenous, and People of Colour) communities and their relationships to the land and food systems.** Land-based and experiential learning should be prioritized wherever possible.
8. **Develop a multi-year roll-out plan** that includes curriculum changes, the engagement of community partners with an expertise in food literacy, professional development for teachers and other school staff, infrastructure modifications and policy development. This roll-out plan should take a flexible approach to enable school boards and school communities to implement the legislation based on their own context, needs, opportunities, gaps and assets in their own communities.

Professional development should equip educators to use hands-on food education as a vehicle for teaching about critical food issues (e.g., food security, food sovereignty, food justice, climate change, cultural awareness, etc.), helping students to make informed decisions throughout their lives and understand what actions are needed to build just, equitable, resilient, and sustainable food systems.
9. **Allocate a sufficient budget** to support the development and implementation of a comprehensive, effective, and sustainable food literacy curriculum that incorporates the above recommendations.

Key Considerations and Opportunities for Roll-Out:

In order to ensure the comprehensive implementation of Bill 216, it will be important to take a number of considerations into account:

Broader framework: It will be valuable to foster linkages between different Ministry of Education policies, frameworks, and initiatives such as: [Foundations for a Healthy School](#), Community-Connected Experiential Learning: A Policy Framework for Ontario Schools, [Ontario's Indigenous Education Strategy](#), and the [Acting Today, Shaping Tomorrow Policy Framework for Environmental Education in Ontario Schools](#). It would also be valuable to explore how food literacy education could align with the Ontario Student Nutrition Program and a possible National School Food Program.

Curriculum revisions: Food can be a fantastic catalyst to teach all areas of the curriculum as it is [not only an object of education, but a vehicle for education](#). As shown in Appendix A, many food literacy competencies are not directly covered in the current curriculum. Embedding food literacy expectations, opportunities and examples in all grades and across subjects of the Ontario curriculum would be valuable as appropriate. Curriculum revisions can draw on existing resources, lesson plans and considerations from both internal and external sources. There are also many opportunities to scale up existing programs such as the Specialist High School Major (SHSM) program, which offers culinary, horticulture and agriculture specializations.

Experiential learning: Extensive benefits can be had from establishing curricula based in experiential learning. Experiential food lessons will provide students with practical life skills to plan, purchase, prepare, and grow food. Such hands-on activities can make students excited about trying new foods and more likely to choose healthy options. Developing these important competencies can also lead to increased confidence and improved self-esteem ([Blair, 2009](#)). Research has shown that experiential food education is associated with personal and academic skill development, including critical thinking, innovation, collaboration, cooperation, problem solving, numeracy, literacy, communication, and thinking about complex issues including our health, the environment, the economy, and our place in the broader food system ([Korzun & Webb, 2014](#); [Williams & Dixon, 2013](#); [Block et al., 2012](#)). Those that provide experiential food-based learning regularly hear that

hands-on experiences that let students connect with food are exciting, that they engage students who are less enthusiastic about school, and that they help make learning real. Land-based learning is an effective way to go about experiential learning and is critical when learning about Indigenous food traditions. For these reasons we advocate that experiential learning activities are prioritized in the curriculum.

Community partner engagement: Many teachers and volunteers feel overloaded and food literacy programming takes time and expertise. As shown with the curriculum and workshop resource examples in the right-hand column of the chart in Appendix A, community partners already support food literacy education in schools throughout the province in many significant ways. It would be valuable to support existing community organizations and partners who have expertise in food literacy to help bring food literacy into schools and to support co-op and career opportunities. Also consider developing the role of comprehensive school-based health educators to support comprehensive school health, or food literacy facilitators (see the [Apple Schools model](#), which has shown a high rate of return on any dollar invested).

Professional development: Teachers and other school staff are not trained to provide food literacy education except for those teachers who are planning to teach family studies and/or hospitality and tourism. To complement support from community partners and/or dedicated food literacy staff, food literacy should be included in both pre-service training and ongoing professional development opportunities and staff should be given release time to attend training. Such training should support a comprehensive approach to bringing food literacy education into the classroom and as well as throughout the whole school environment. It should draw on the expertise of experienced food literacy teachers, registered dietitians and other community partners. Training and professional development would be best complemented by resources that share teaching concepts and opportunities to embed food literacy education into the curriculum. Such resources should be assessed for quality/accuracy using standardized criteria.

Infrastructure: Ontario schools were often not built with facilities, kitchens and gardens needed to accommodate hands-on experiential food literacy learning for large numbers of students. It will be important to consider how to fill the gap in school infrastructure for experiential food literacy. Optimizing these opportunities will require creativity and financial resources. Implementation could be planned over a longer time period for both retrofits and future school design, although a great deal can be achieved with existing resources and facilities in many schools. Similar approaches have been taken in Ontario with acts such as the [Accessibility for Ontarians with Disabilities Act, 2005 \(AODA\)](#), which specified that changes to the built environment were to occur over a number of years to enable institutions and organizations to have enough time to make modifications where necessary. A joint-letter by the Council of Ontario Directors of Education and Council of Ontario Medical Officers of Health ([CODE-COMOH letter](#)) to the Premier of Ontario recommends developing legislation that any new schools must include adequate infrastructure for food skills development. Many innovative approaches could be applied to the lack of physical infrastructure for food literacy in schools. For example, some schools and organizations have made use of mobile kitchen carts and other portable food skills equipment such as blenders, crock pots and kettles as well as the use of community or commercial kitchens and gardens. These types of innovative examples provide a basis for immediate opportunities for experiential food literacy education in Ontario schools and communities. Infrastructure considerations of this nature are important and timely as the federal government contemplates the development of a National School Food Program since funds could be coordinated across jurisdictions.

Building on Existing Law and Policy: Future directions in the implementation of Bill 216 could draw upon a number of existing laws and policies:

- Environmental Education: The Ontario Ministry of Education has highlighted the importance of environmental education through [Shaping our Schools, Shaping our Future: Environmental Education in Ontario Schools](#) (2007) and the [Framework for Environmental Education in Ontario Schools](#) (2009). The framework provides an excellent model for how food literacy could be integrated into the Ontario curriculum.
- The [Local Food Act, 2013](#) calls for “improv[ing] food literacy in respect of local food”, which was expanded in a later release of [Local Food Literacy Goals](#) by the Ontario Ministry of Agriculture, Food and Rural Affairs (OMAFRA). These goals include “Increase the number of Ontarians who know what local foods are available”, “Increase the number of Ontarians who know how and where to obtain local foods”, and “Increase the number of Ontarians who prepare local food meals for family and friends, and make local food more available through food service providers”. Bill 216 poses a significant opportunity to realize these goals.
- The [Food Policy for Canada](#), released in 2019, announced the desire to consult towards a National School Food Program. It stated that “The Government of Canada will also engage with provinces, territories, and key stakeholder groups to work toward the creation of a National School Food Program” (p. 9). This commitment was initially made in the 2019 federal budget plan (at p. 163). Bringing more healthy food into schools in a shared meal environment would undoubtedly support Bill 216 and make many opportunities for food literacy learning available.
- It will also be important to consider what supportive policies are needed such as school-board level wellness policies and the development of a set of standards for food literacy education similar to the [Standards for Environmental Education in the Curriculum](#) (2008).

Appendix A: Desired food literacy competencies, Existing curriculum links, Curriculum gaps and Example resources and plans

The following table identifies food literacy competencies that have been articulated in various relevant frameworks, shares a preliminary examination of where these competencies exist in the current curriculum, identifies observed curriculum gaps and highlights examples of existing resources and lesson plans that have been provided by external organizations to fill the gaps in curriculum.

Many of the desired competencies in this table have been drawn from two sources, which have been colour-coded in the document:

- [Ontario Dietitians in Public Health - Food Literacy Framework](#)
- [Canada’s Food Guide, 2019 - Canada’s Dietary Guidelines for Health Professionals and Policy Makers](#)

Note that the items identified in the “Existing Curriculum Links” column are **not a complete list** but begin to form a picture from an initial set of searches.

Dimension: Health and Nutrition			
Food Literacy Attribute: Food Knowledge			
Desired Competency	Existing Curriculum Links	Curriculum Gaps	Ex. Resources / Lesson Plans
<p>Knowing about a wide variety of foods (Declarative)</p>	<p>Direct curriculum expectations:</p> <p>Gr 3 Health and Physical Education D3.1: explain how local foods and foods from various cultures (e.g., berries, curries, chapatis, lychees, kale, lentils, corn, naan, wild game, fish, tourtière) can be used to expand their range of healthy eating choices</p> <p>Gr 11 Food and Culture - Foods and Flavours C1. Food Availability: demonstrate an understanding of the relationship between geography and the foods naturally found and/or produced in Canada and various other countries; C2. Sources of Foods: demonstrate an understanding of the sources of foods eaten in Canada and in various other countries/ cultures</p>	<p>Very few direct links</p>	<p>FoodLand Ontario Kids’ Corner</p> <p>Ecosource - Classroom Connects (Gr 9-12)</p> <p>Healthy Eating Habits (AgScape)</p> <p>Food Around the World (AgScape)</p> <p>All About Food (AIT-C)</p> <p>Fruits and Veggies Everyday (AgScape)</p> <p>Grown and Produced in Ontario (AgScape)</p> <p>Eat Local?
